

Power

Kalbarri needs an independent power supply and sustainable energy is the way to go because we have abundant wind and solar potential energy. Pushing power up wires from Perth 650 kms away has proven to be a continual failure and is inherently inefficient. Much grief has been caused to domestic and business users. By continual power failures, some very prolonged has been damaging to our , tourism potential which is vital for our town, domestic appliances, food supplies. Denham is a town similar in size to Kalbarri and it has a successful independent power supply using wind and domestic solar with diesel backup. A lot of people in Kalbarri have solar panels installed to try and ease the load on the rickety system in place but when we have a power failure , these panels sit there dead. If we had our own power supply then there would be better utilisation of people.

Kind regards

John Laverack
